## CHESAPEAKE BAY DREDGING

| In the Maryland waters of the Bay, the US Army Corp of Engineers (USACE) and the Maryland Department of Natural Resources (DNR) oversee dredging operations. DNR is responsible for small scale dredging operations that are geographically distributed and typically underfunded.

## FOCUS AREAS

DNR identified two focus areas for the beneficial use suitability mode based on the frequency of channel dredging, volume of dredged sediment, cost of dredging, and commercial and recreational impacts associated with shoaling in each of the areas.

FOCUS AREA 1  
Kent Narrows

FOCUS AREA 2  
Lower Wicomico River

CHESAPEAKE BAY

KENT NARROWS

Department of Natural Resources Dredge Channel

Authorized Depth (ft): 7

Authorized Width (ft): 75

Last Dredged: 2007

Approx. Dredging Frequency (years): 5

Last Dredge Volume (cubic yards): 25,031

LOWER WICOMICO RIVER

Department of Natural Resources Dredge Channel

Authorized Depth (ft): 14

Authorized Width (ft): 150

Last Dredged: 2013

Approx. Dredging Frequency (years): 4

Last Dredge Volume (cubic yards): 124,687

## KENT NARROWS

Kent Narrows is a waterway used by recreational and commercial vessels to travel from the Chester River to the Eastern Bay. DNR has previously implemented beneficial use projects at the Chesapeake Bay Environmental Center and Ferry Point Park.

## LOWER WICOMICO RIVER

The Lower Wicomico River is a navigation channel that leads to the Port of Salisbury on the Eastern Shore. DNR has previously implemented a beneficial use project at the Ellis Bay Wildlife Management Area.

Landform  
Parameter

Dredge Proximity  
Parameter

Beneficial Use  
Parameter

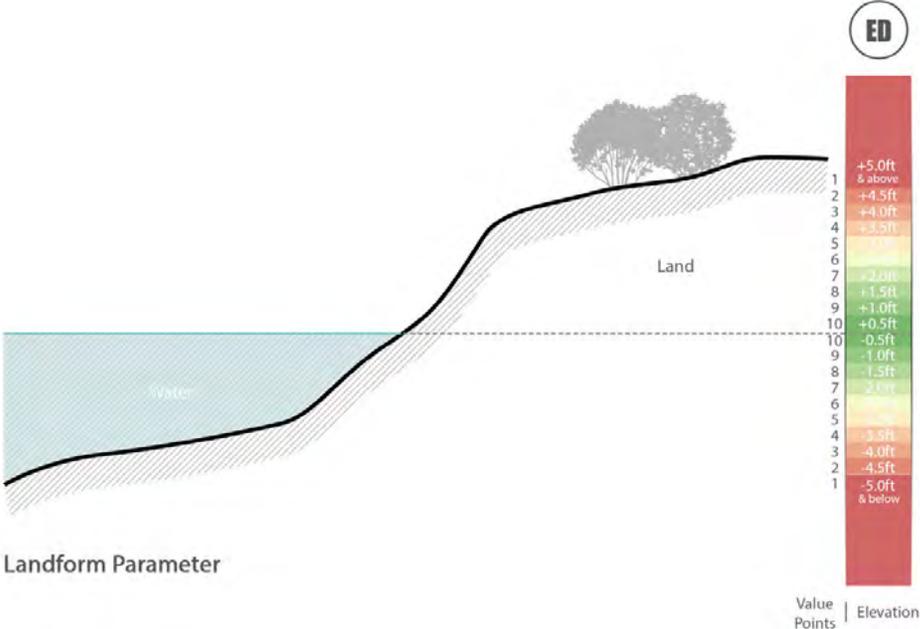

Coastal Risk  
Parameter

## SUITABILITY MODEL PARAMETERS

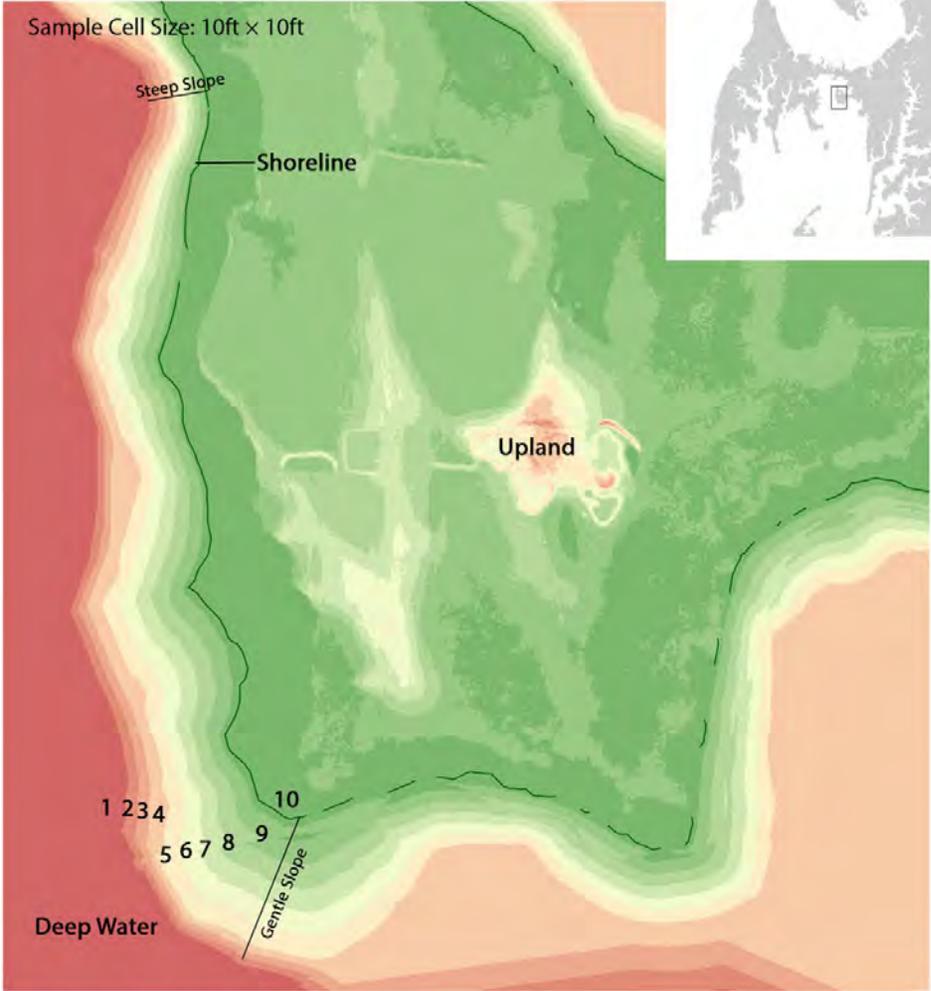

The suitability model uses a multi-parameter framework to identify and prioritize locations for beneficial use of sediment. The model output for Kent Narrows highlights the different ways each individual parameter influences the composite analysis.

# LANDFORM PARAMETER

Purpose: Outline the most valuable area for dredge placement by identifying shallow area within five-foot range of elevation from the sea level

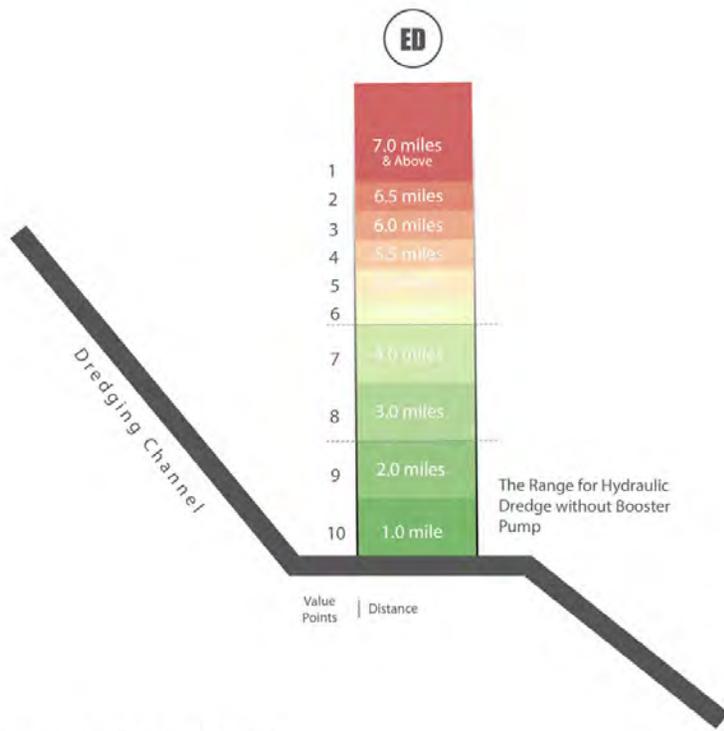

Landform Parameter

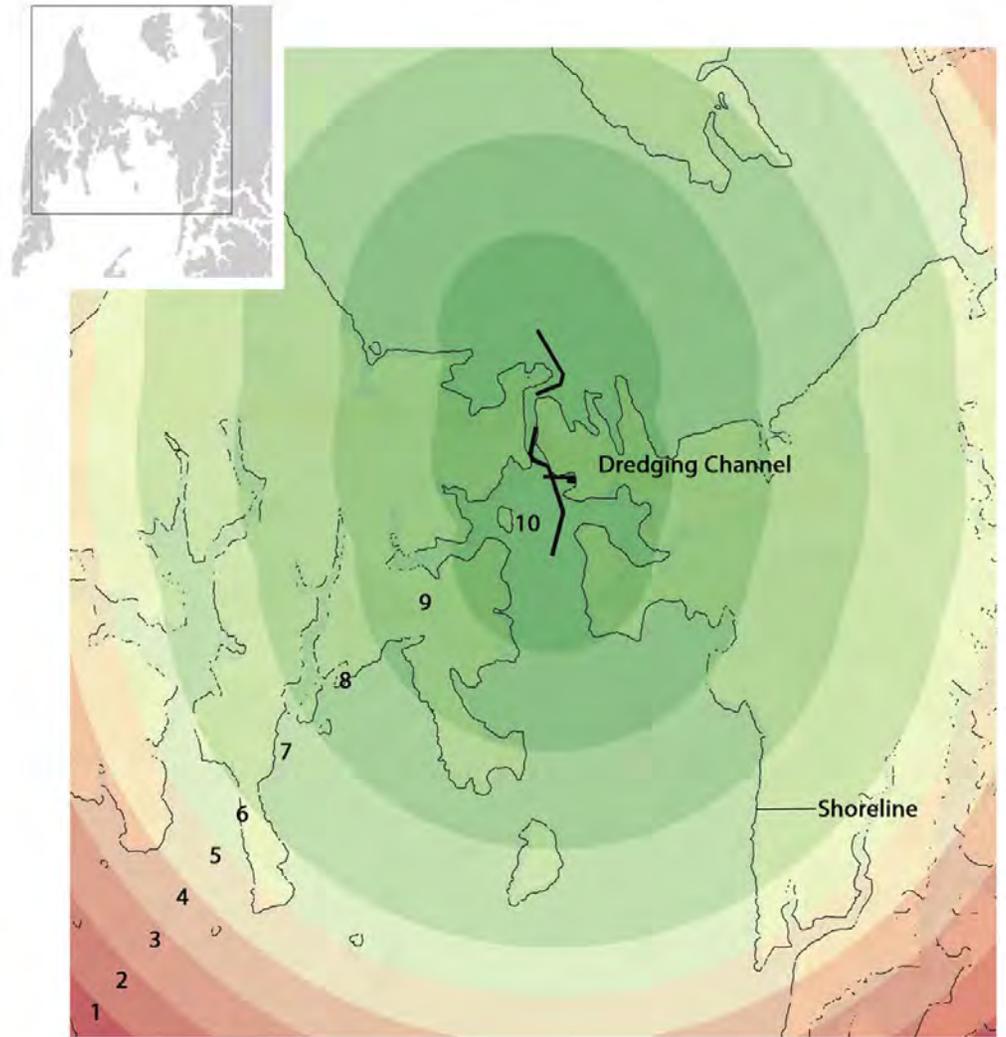

Map Illustration

# DREDGE PROXIMITY PARAMETER

Purpose: Rank the suitable area based on the distance from dredging channel to potential placement sites

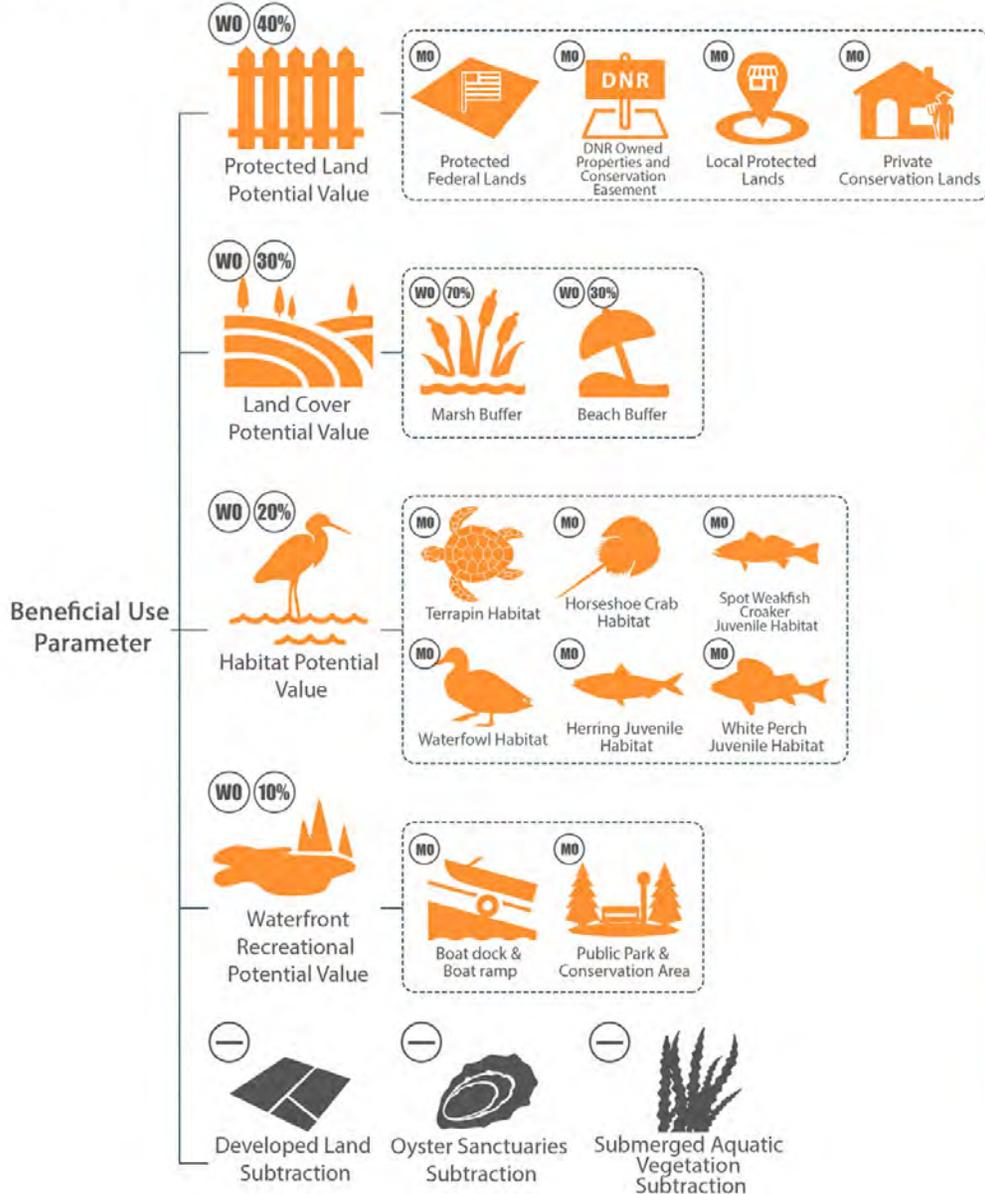

Dredge Proximity Parameter

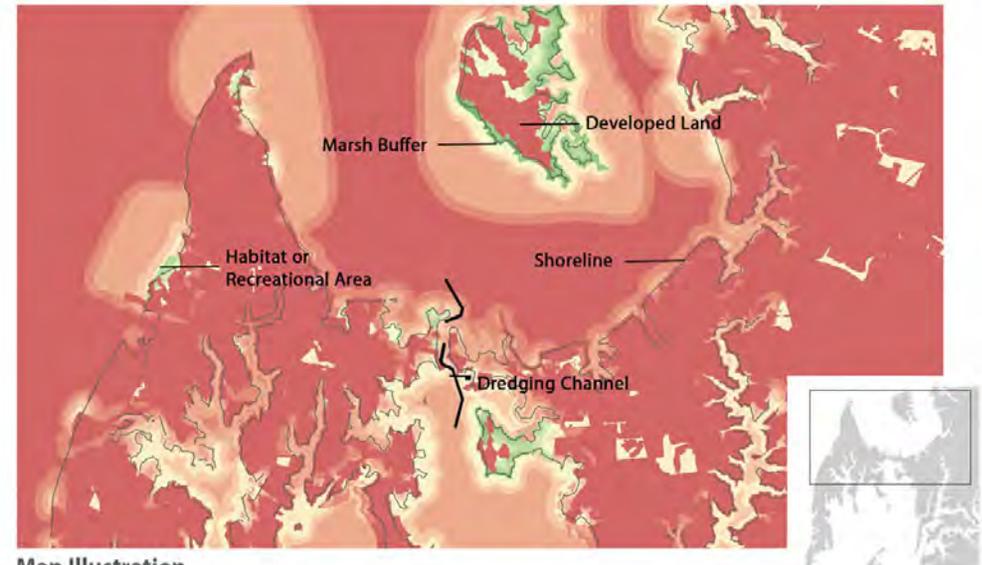

Map Illustration

# BENEFICIAL USE PARAMETER

Purpose: Rank the suitable area for beneficial end use by integrating land cover, habitat and recreational use data

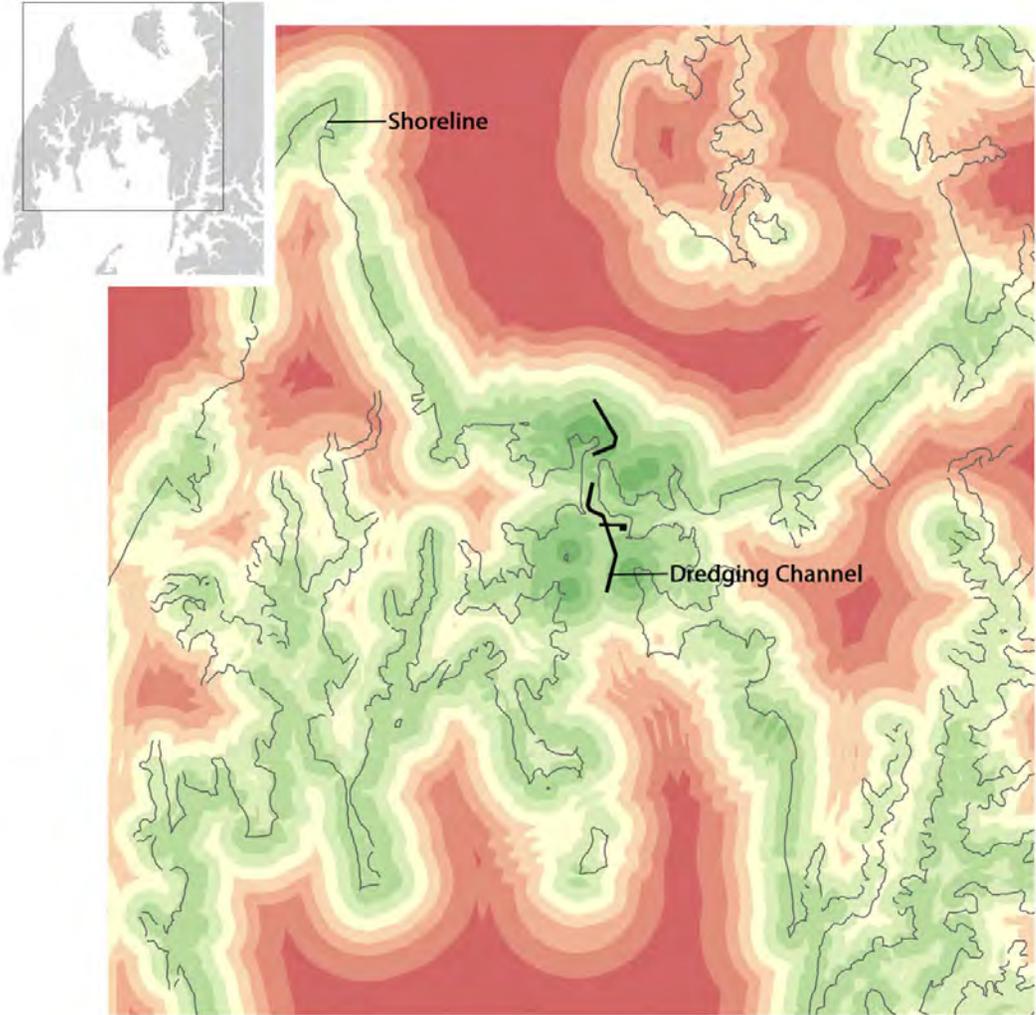

## Ranking the Buffer Zone (Excluding Protected Land Potential Value)

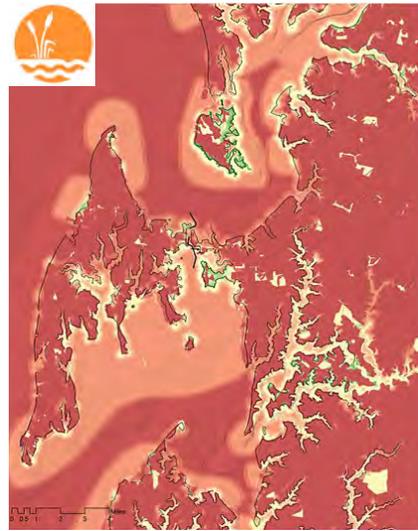

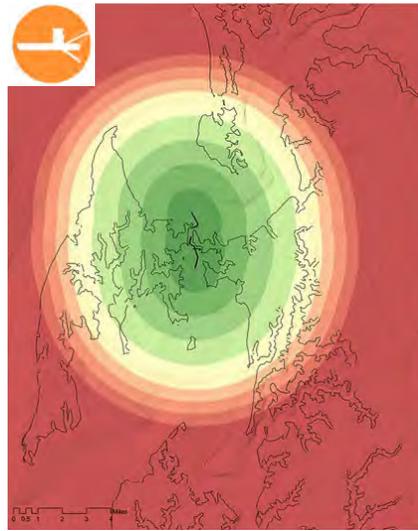

Map Illustration

# COASTAL RISK PARAMETER

Purpose: Rank the suitable area where shorelines are necessary to be protected by placing dredging materials in responding to coastal hazards

Map Illustration

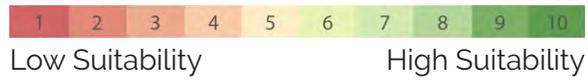

KENT NARROWS Suitability Map Outputs

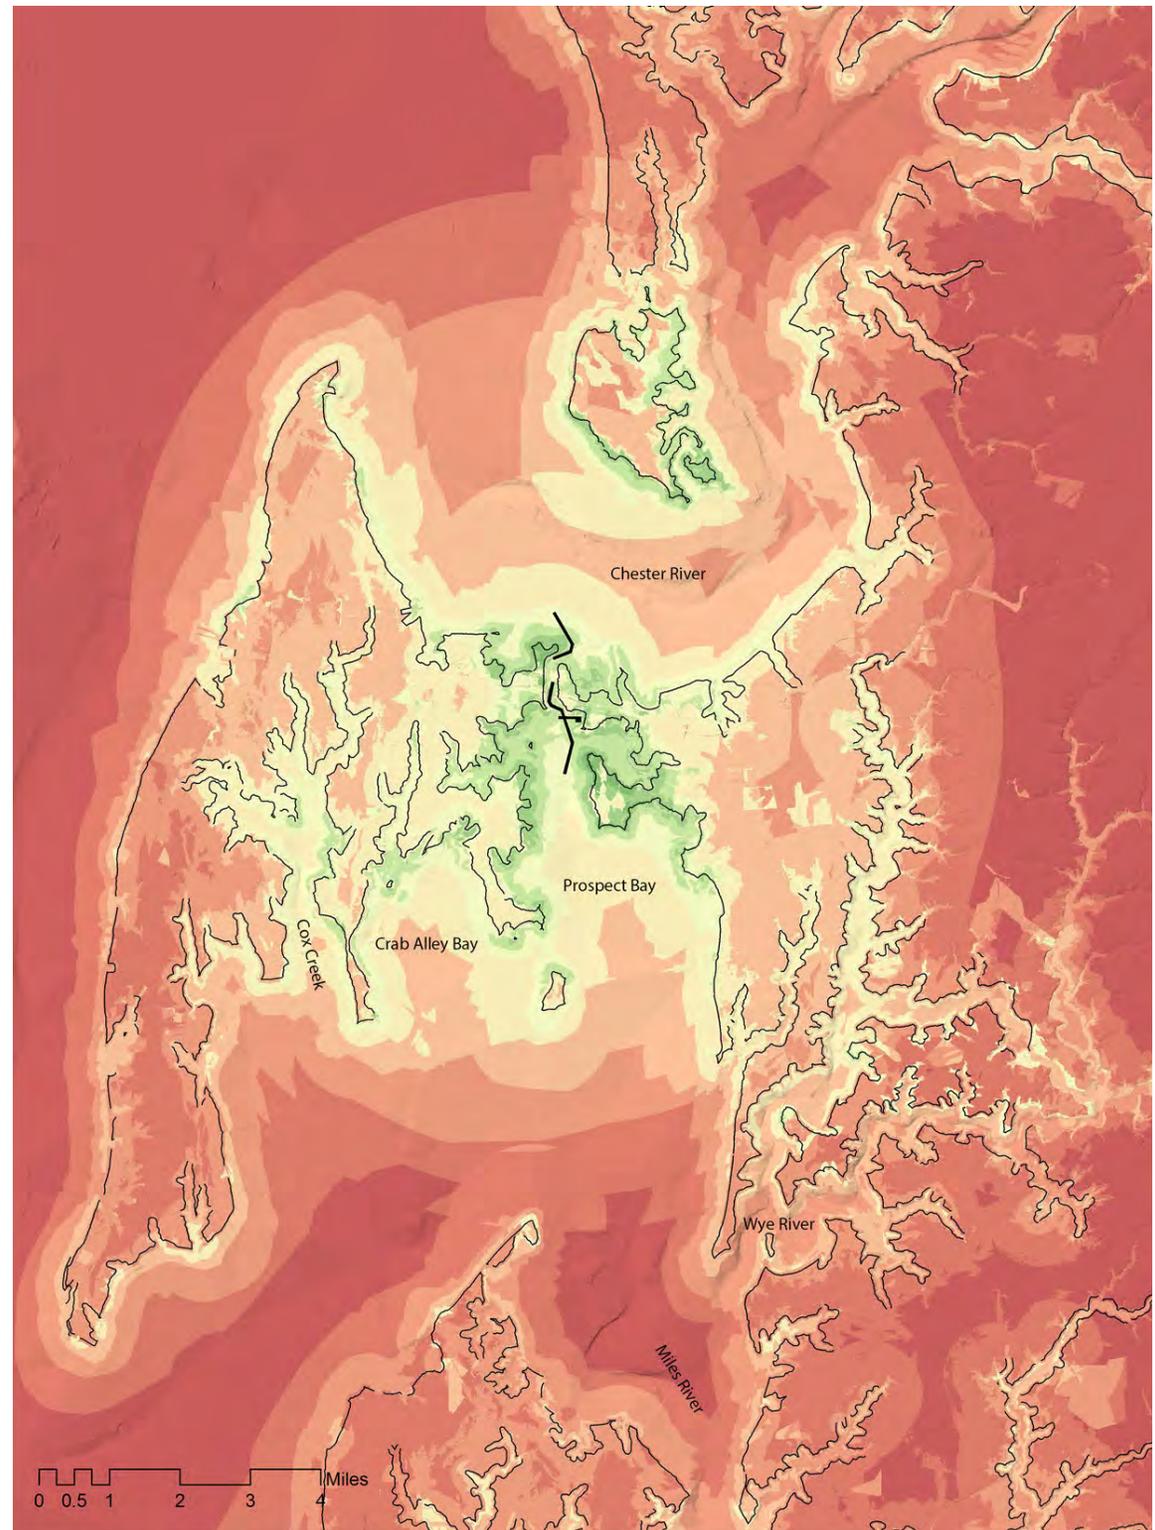

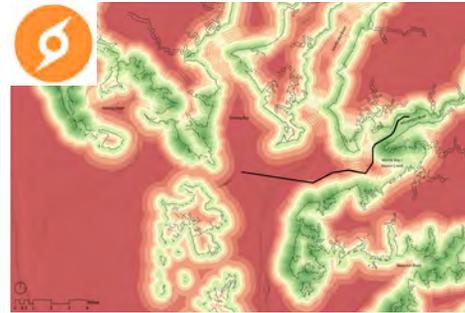

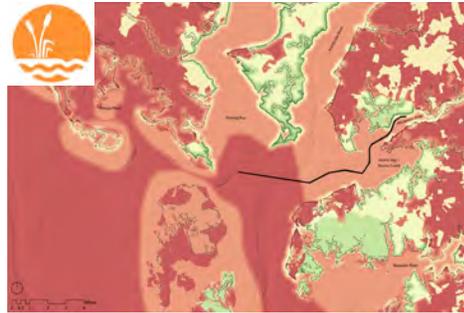

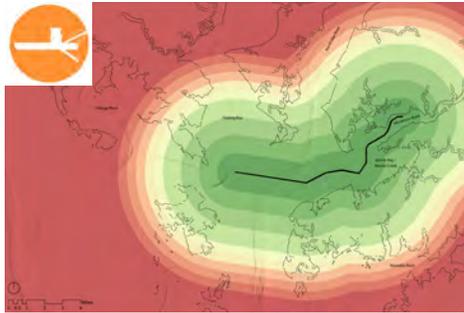

## KENT NARROWS SUITABILITY MODEL

The Kent Narrows suitability output uses an aggregate weight of Landform 10%, Dredge Proximity 35%, Beneficial Use 35%, and Coastal Risk 20%. High suitability sites are shown in dark green while low suitability sites are shown in dark red.

- INTEGRATED MAP**
- Landform 10% 
  - Dredge Proximity 35% 
  - Beneficial Use 35% 
  - Coastal Risk 20% 

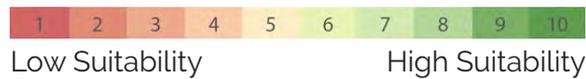

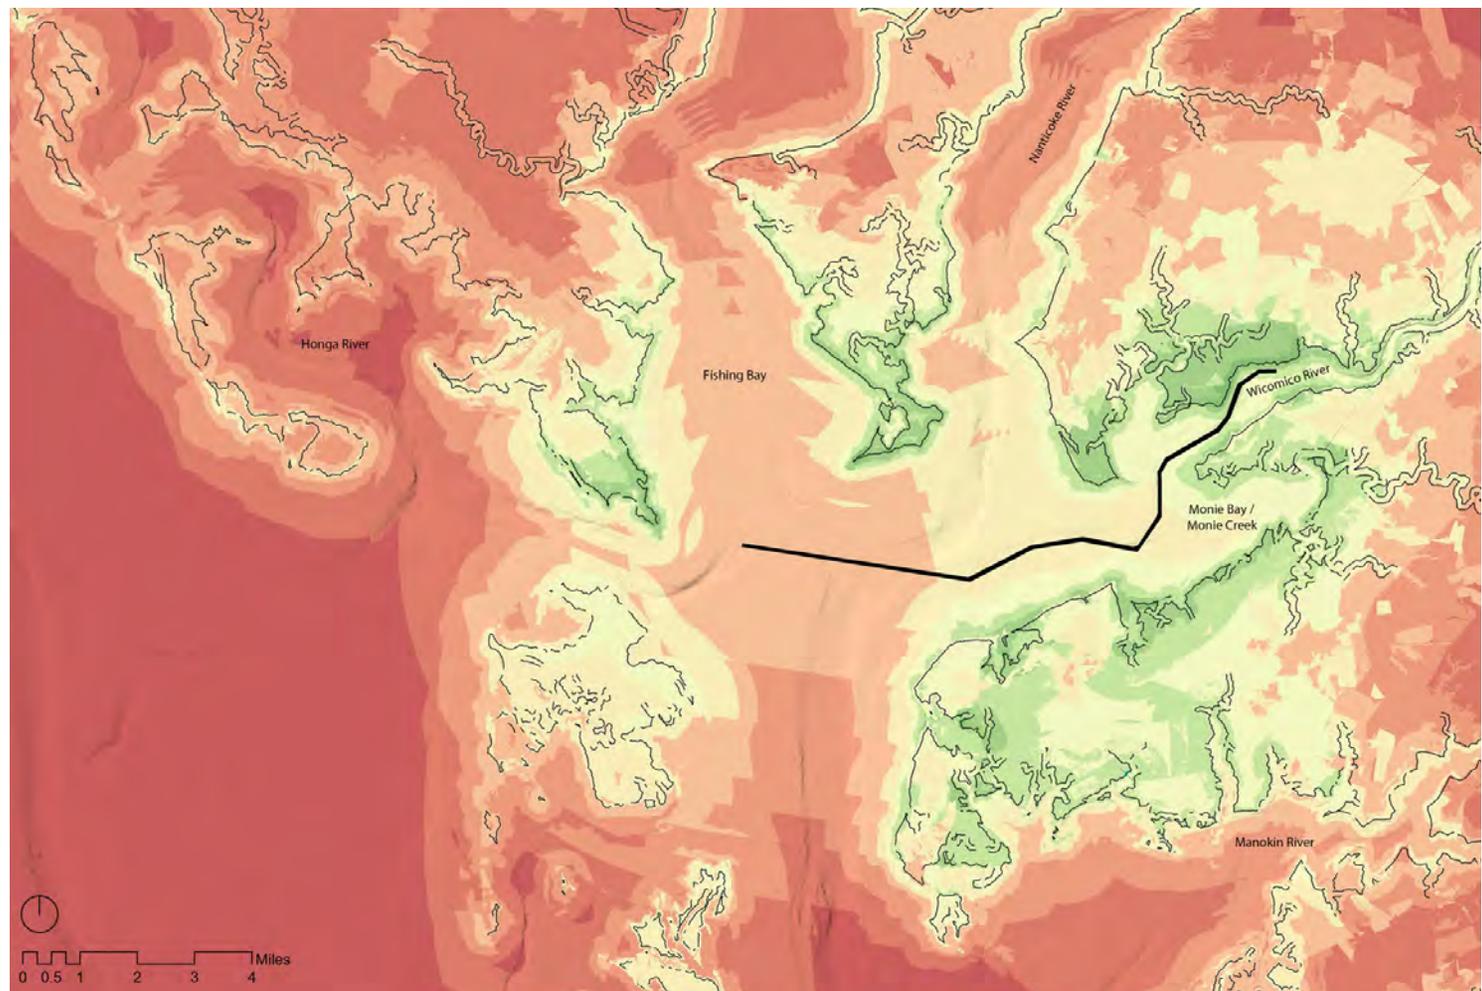

LOWER WICOMICO RIVER Suitability Map Outputs

## LOWER WICIMICO RIVER SUITABILITY MODEL

The Lower Wicomico River suitability output uses an aggregate weight of Landform 10%, Dredge Proximity 35%, Beneficial Use 35%, and Coastal Risk 20%. High suitability sites are shown in dark green while low suitability sites are shown in dark red.

## INTEGRATED MAP

- Landform 10%
- Dredge Proximity 35%
- Beneficial Use 35%
- Coastal Risk 20%

# PRECEDENT PROJECTS

To support implementation of the beneficial use design strategies, the team researched successful regional and international precedents. These examples of beneficial use highlight the value of sediment in habitat restoration and coastal resiliency applications.

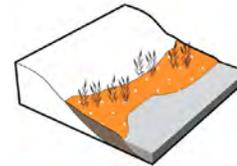

Beach Nourishment/Feeder Berm

*Sand Engine* (South Holland, Netherlands)

*South Hayling Island Beach* (Hampshire, England)

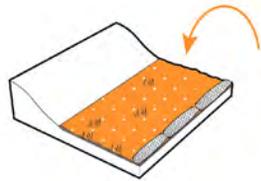

Living Shoreline

*Eastern Neck* (Maryland, USA)

*Deadman's Island* (Florida, USA)

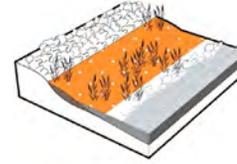

Thin Layer Placement

*Blackwater National Wildlife Refuge* (Maryland, USA)

*Blackwater National Wildlife Refuge* (Maryland, USA)

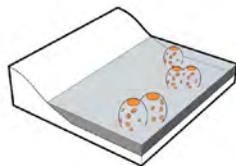

Structural/Hybrid Living Shoreline/Marsh Sill

*Jefferson Patterson Park & Museum* (Maryland, USA)

*Pine Knoll Shores* (North Carolina, USA)

Artificial Reef/Oyster Reef

*West Bay* (Texas, USA)

*Malcolm Road Beach* (Providenciales, Turks & Caicos Islands)

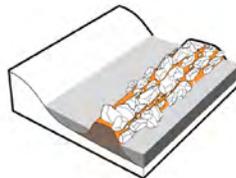

Coastal/Tidal/Non-tidal Wetland/Wetland Buffer

*Poplar Island* (Maryland, USA)

*Blackwater National Wildlife Refuge* (Maryland, USA)

Living Breakwater

*West Bay* (Texas, USA)

*Port of Beirut* (Beirut, Lebanon)

Dunes & Eelgrass

*PEI National Park* (Prince Edward Island, Canada)

*Beach of Annoville* (Manche, France)

## DESIGN STRATEGIES

Beneficial use design strategies offer an opportunity to leverage sediment as a resource in restoration and resiliency efforts. Strategies are categorized according to common landscape types found in the Chesapeake Bay and along a continuum from natural/nature-based to structural.

### NATURAL/NATURE-BASED

### STRUCTURAL

Soil

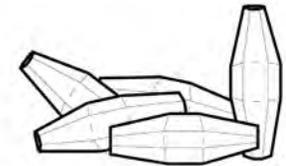

Soil

+

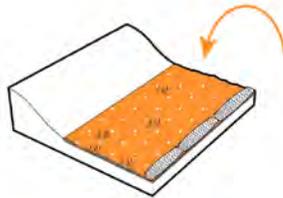

Rock & Natural Biodegradable Log, etc.

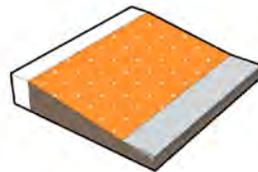

Dolos

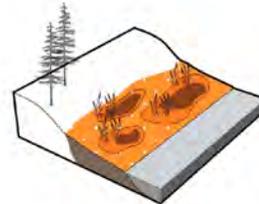

### MARSH

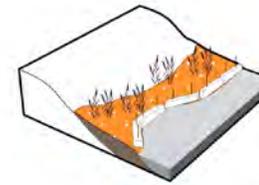

Thin Layer Placement

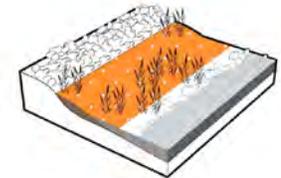

Horizontal Levee

Wetland Buffer

Living Shoreline

Structural Living Shoreline/Marsh Sill

### BEACH

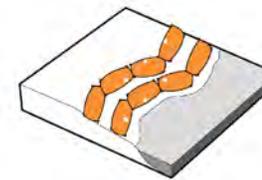

Beach Nourishment/Feeder Berm

Dune with Vegetation

Dune with Fence

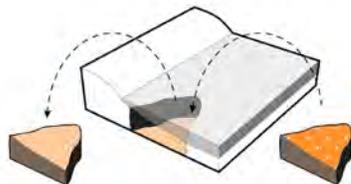

Geotube Barrier

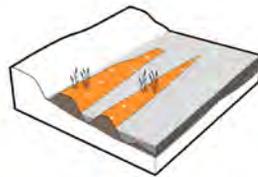

Dredge Fill Dike

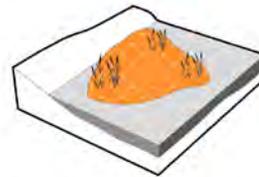

### OPEN WATER

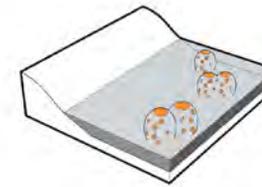

Confined Aquatic Disposal (CAD)

Soft Sea Wall Defense

Island Restoration

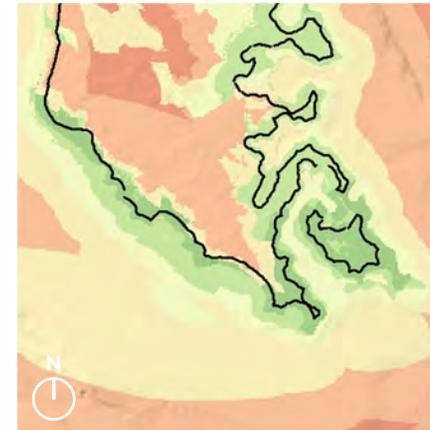

Artificial Reef Structure

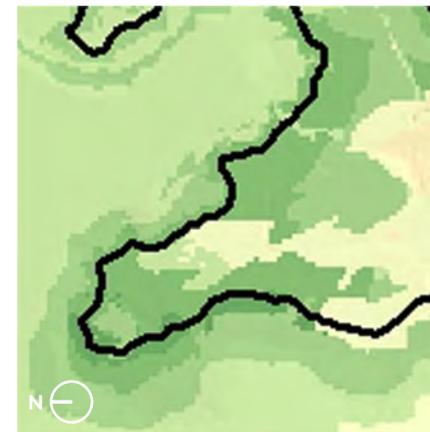

Living Breakwater

## HIGH SUITABILITY SITES

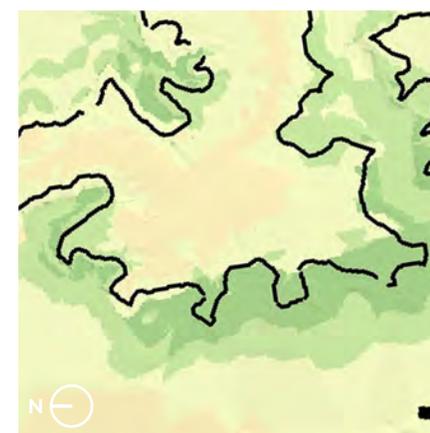

The team identified three high suitability sites for beneficial use within each focus area. The Kent Narrows sites include Eastern Neck North, Chesapeake Bay Environmental Center, and Crab Alley Neck North.

**Balanced**  
Landform 10%  
Dredge Proximity 35%  
Beneficial Use 35%  
Coastal Risk 20%

**Balanced**  
Landform 10%  
Dredge Proximity 35%  
Beneficial Use 35%  
Coastal Risk 20%

**Balanced**  
Landform 10%  
Dredge Proximity 35%  
Beneficial Use 35%  
Coastal Risk 20%

# DESIGN STRATEGIES AT EASTERN NECK NORTH

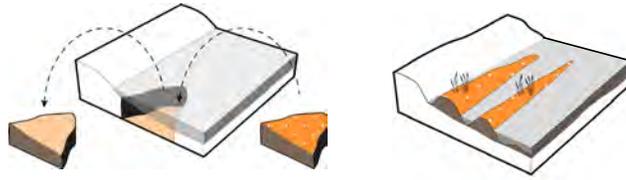

Utilizing insight from both the quantitative and qualitative analysis of the Eastern Neck North site, the team identified potential beneficial use design strategies for each of the site's landscape typologies including beach, marsh, and open water strategies.

## BEACH STRATEGY

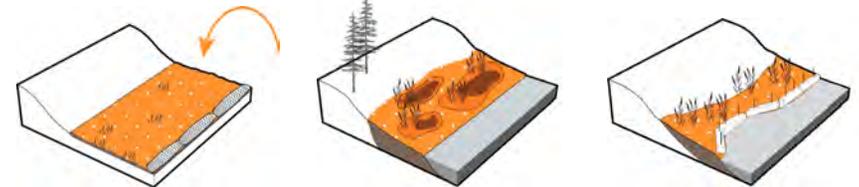

Beach Nourishment

## OPEN WATER STRATEGY

Confined Aquatic Disposal (CAD) and/or Soft Sea Wall Defense

## MARSH STRATEGIES

Thin Layer Placement and/or Wetland Buffer and/or Living Shoreline

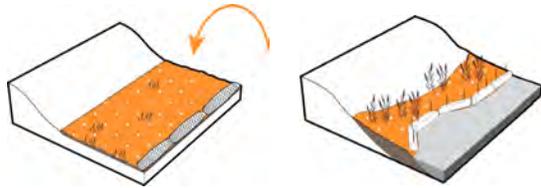

Areas with the Highest Suitability Value

# DESIGN STRATEGIES AT CHESAPEAKE BAY ENVIRONMENTAL CENTER

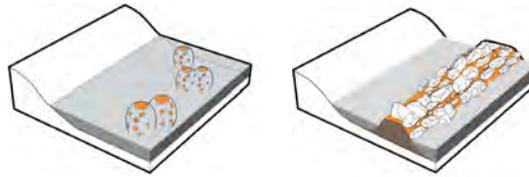

Utilizing insight from both the quantitative and qualitative analysis of the Chesapeake Bay Environmental Center site, the team identified potential beneficial use design strategies for each of the site's landscape typologies including beach, marsh, and open water strategies.

## MARSH STRATEGIES

Thin Layer Placement and/or Living Shoreline

## OPEN WATER STRATEGY

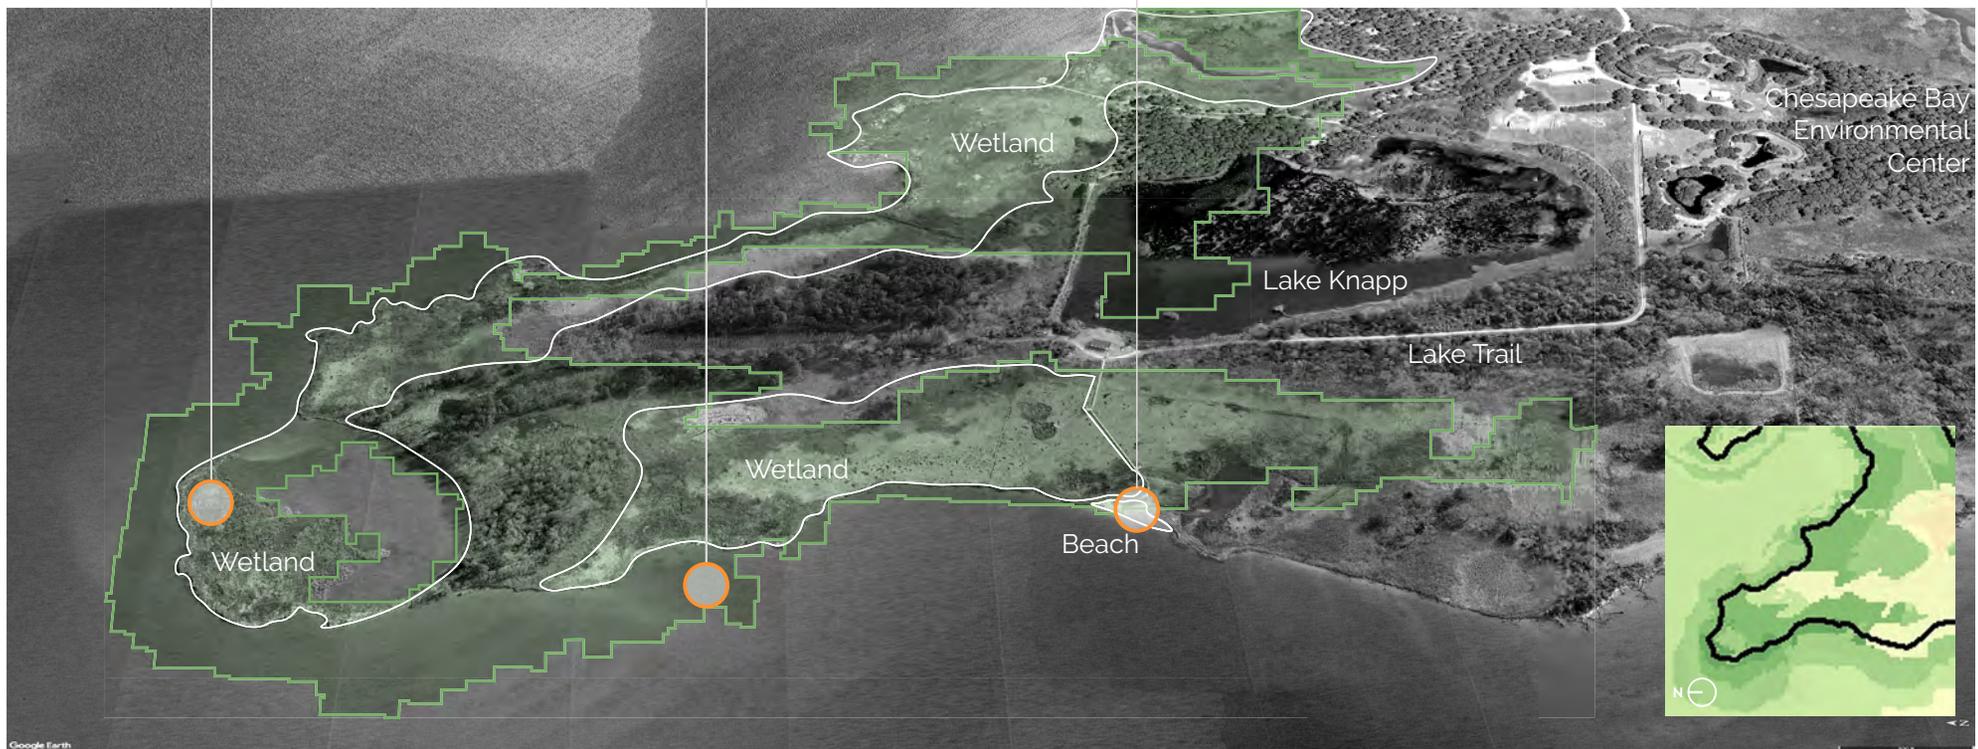

Artificial Reef Structure and/or Living Breakwater

## BEACH STRATEGY

Beach Nourishment/Feeder Berm

Areas with the Highest Suitability Value

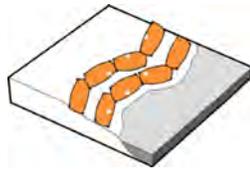

## BENEFICIAL USE STRATEGIES AT CRAB ALLEY NECK NORTH

Utilizing insight from both the quantitative and qualitative analysis of the Crab Alley Neck North site, the team identified potential beneficial use design strategies for each of the site's landscape typologies including beach, marsh, and open water strategies.

### BEACH STRATEGIES

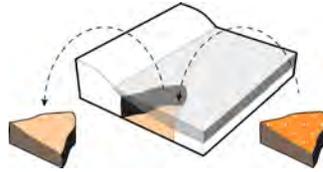

Beach Nourishment/Feeder Berm

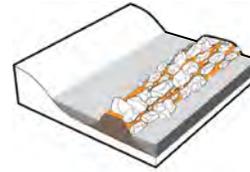

and/or Geotube Barrier

### OPEN WATER STRATEGY

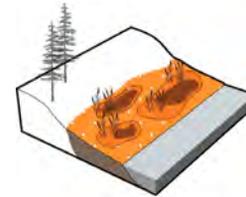

Confined Aquatic Disposal (CAD)

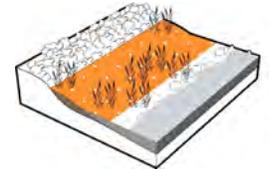

and/or Living Breakwater

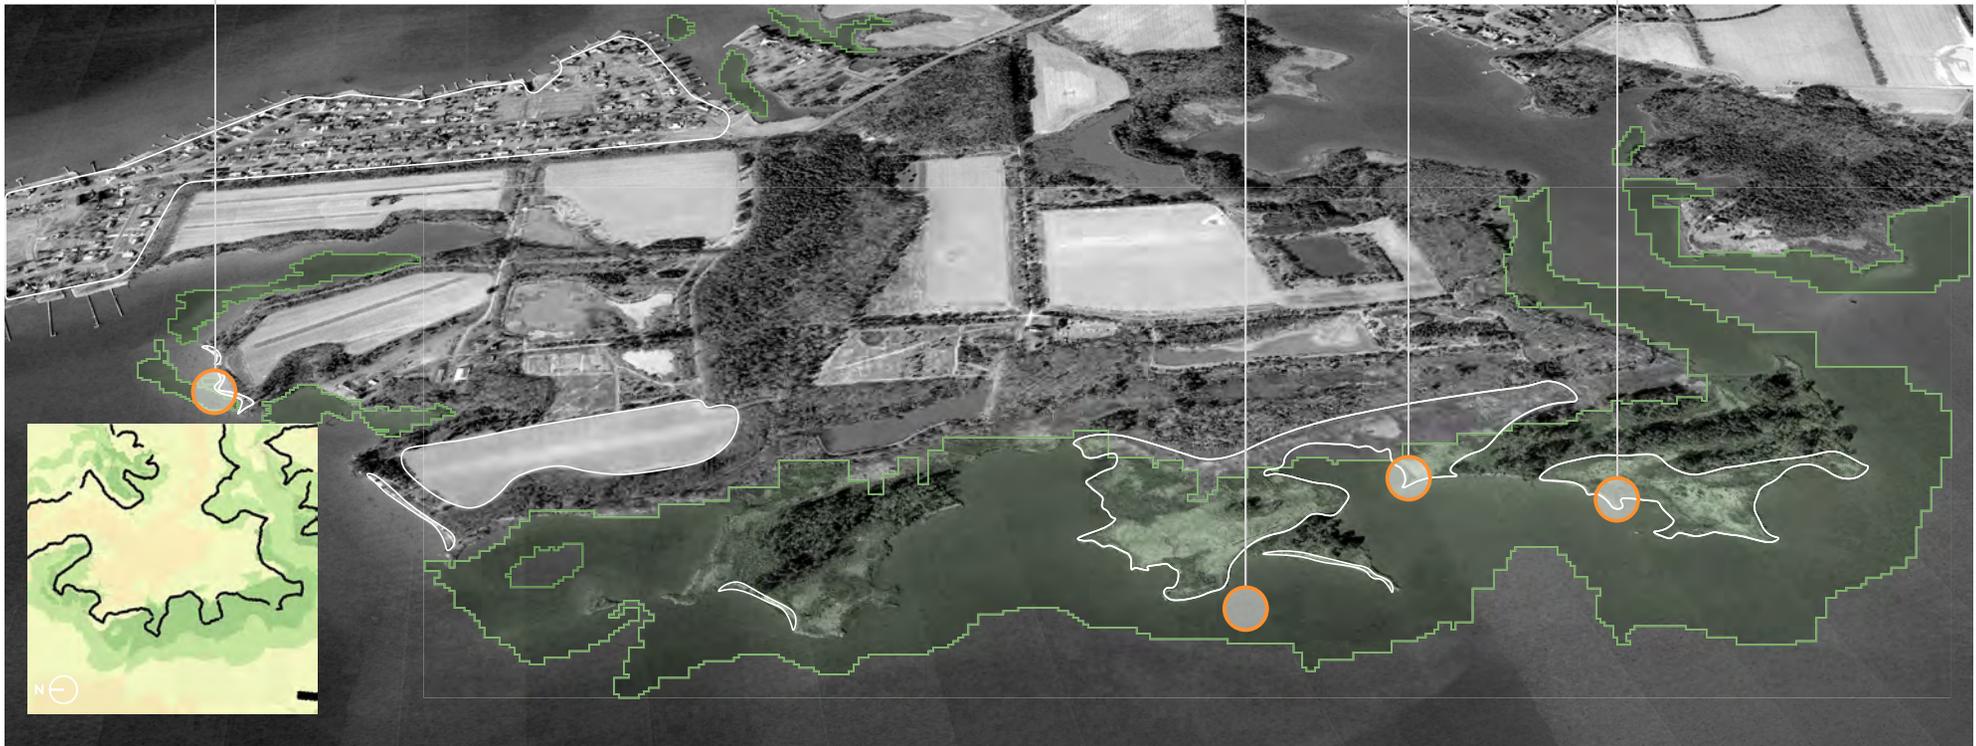

### MARSH STRATEGIES

Wetland Buffer

and/or Hybrid Living Shoreline/Marsh Sill

Areas with the Highest Suitability Value

## OVERLAY

### WO Weighted Overlay

Calculate the weighted average:  
 $6 \times 50\% + 5 \times 50\% = 5.5$   
 Then round up to integer 6

6	4	3	1
1	1	2	4
8	10	1	6
1	8	1	4

Data One:  
50% Weight

5	1	1	2
5	9	2	2
7	9	1	3
2	7	2	1

Data Two:  
50% Weight

6	3	2	2
3	5	2	3
8	10	1	5
2	8	2	3

Output

### MO Maximum Overlay

Compare two numbers and select larger one  
 for output:  $6 > 5$ , then output = 6

6	4	3	1
1	1	2	4
8	10	1	6
1	8	1	4

Data One

5	1	1	2
5	9	2	2
7	9	1	3
2	7	2	1

Data Two

6	4	3	2
5	9	2	4
8	10	1	6
2	8	2	4
